METHOD OF ADDRESSING QUERY SCHEDULING
AND SYSTEM RESOURCE REQUIREMENTS

ABSTRACT OF THE DISCLOSURE

Method, system and article of manufacture for scheduling queries. In particular, the scheduling options made available to a user for a particular unit of work are determined dynamically at the time of scheduling. In this way, the execution cost, for example, of a particular unit of work can be taken into account when determining which scheduling options to make available. In addition, or alternatively, system availability and/or user parameters may be accounted for when determining which scheduling options to make available.
